**ABSTRACT:** "Random-time Toda equation" is obtained by replacing the time-interval of the discrete-time Toda equation by random variables. The random-time Toda equation has higher-order conserved quantities in spite of the randomness introduced to the equation. Also obtained are the higher-order conserved quantities of a class of "Random-time soliton equations" which are related to the random-time Toda equation via Miura transformations.

**KEYWORDS:** Toda equation, randomness, conserved quantities, Miura transformation

In this letter we present "Random-time Toda equation" where the time-interval of the discrete-time Toda equation are replaced by random variables, and show a Lax pair of the

random-time Toda equation which gives higher-order conserved quantities in spite of the randomness introduced to the equation.

We have the Toda equation of the form

$$\frac{d}{dt} J_n = V_{n-1} - V_n, \quad (1)$$

$$\frac{d}{dt} \log V_n = J_n - J_{n+1}, \quad (2)$$

which we discretized in a previous paper <sup>1)</sup> in the following form

$$J_n^{m+1} - \delta V_{n-1}^{m+1} = J_n^m - \delta V_n^m, \quad (3)$$

$$V_n^{m+1}(1 - \delta J_n^{m+1}) = V_n^m(1 - \delta J_{n+1}^m), \quad (4)$$

where  $\delta$  is the time-interval and  $t = m\delta$  for integers  $m$ . We called a couple of equations (3) and (4) "Discrete-time Toda equation".

Now we replace the time-interval  $\delta$  in Eqs.(3) and (4) by random variables  $\delta^m$  in the following way

$$J_n^{m+1} - \delta^{m+1} V_{n-1}^{m+1} = J_n^m - \delta^m V_n^m, \quad (5)$$

$$V_n^{m+1}(1 - \delta^{m+1} J_n^{m+1}) = V_n^m(1 - \delta^m J_{n+1}^m), \quad (6)$$

which we call "Random-time Toda Equation".

Let us introduce new dependent variables  $x_n, \hat{x}_n, y_n, \hat{y}_n$ , by the following relations:

$$x_n^m = J_n^m - \delta^m V_{n-1}^m, \quad (7)$$

$$\hat{x}_n^m = J_n^m - \delta^m V_n^m, \quad (8)$$

$$y_n^m = V_n^m(1 - \delta^m J_n^m), \quad (9)$$

$$\hat{y}_n^m = V_n^m(1 - \delta^m J_{n+1}^m). \quad (10)$$

Then the random-time Toda equation is written in a simple form:

$$x_n^{m+1} = \hat{x}_n^m, \quad (11)$$

$$y_n^{m+1} = \hat{y}_n^m. \quad (12)$$

Then, a Lax pair  $\{L, A\}$  of the random-time Toda equation under the periodic boundary conditions:

$$V_{N+1}^m = V_1^m, \quad (13)$$

$$I_{N+1}^m = I_1^m, \quad (14)$$

is expressed as follows.

$$L^m = \begin{pmatrix} 1 - c^m x_1^m & c^m & 0 & \dots & 0 & c^m y_N^m \\ c^m y_1^m & 1 - c^m x_2^m & c^m & \dots & 0 & 0 \\ 0 & c^m y_2^m & 1 - c^m x_3^m & \dots & 0 & 0 \\ \dots & \dots & \dots & \dots & \dots & \dots \\ 0 & \dots & \dots & \dots & 1 - c^m x_{N-1}^m & c^m \\ c^m & 0 & 0 & \dots & c^m y_{N-1}^m & 1 - c^m x_N^m \end{pmatrix},$$

$$A^m = \begin{pmatrix} 1 & 0 & 0 & \dots & \delta^m V_N^m \\ \delta^m V_1^m & 1 & 0 & \dots & 0 \\ 0 & \delta^m V_2^m & 1 & \dots & 0 \\ \dots & \dots & \dots & \dots & 0 \\ 0 & 0 & 0 & \delta^m V_{n-1}^m & 1 \end{pmatrix}, \quad (15)$$

where  $c^m$  are arbitrary constants.

It is easy to see that a commutation relation:

$$A^m L^{m+1} - L^m A^m = 0 \quad (16)$$

gives the random-time Toda equation under the periodic boundary condition.

Eq.(16) gives higher conserved quantities  $H_n (= \text{Trace}[L^m]^n, n = 1, 2, 3, \dots)$  of the random-time Toda equation because that

$$\text{Trace}[L^{m+1}]^n = \text{Trace}[L^m]^n. \quad (17)$$

We have shown in a previous paper <sup>2)</sup> that Miura transformations generate higher-order conserved quantities of a class of discrete soliton equations which are related to the discrete-time Toda equation. Similarly we obtain in the present paper higher-order conserved quantities of a class of "Random-time soliton equations" which are related to the random-time Toda equation via Miura transformations.

We have the Random-time Toda equation

$$J_n^{m+1} - \delta^{m+1} V_{n-1}^{m+1} = J_n^m - \delta^m V_n^m, \quad (18)$$

$$V_n^{m+1}(1 - \delta^{m+1} J_n^{m+1}) = V_n^m(1 - \delta^m J_{n+1}^m), \quad (19)$$

which is related to "Random-time Lotka-Volterra equation of type I"

$$v_n^{m+1}(1 - \delta^{m+1} v_{n-1}^{m+1}) = v_n^m(1 - \delta^m v_{n+1}^m) \quad (20)$$

via the Miura transformation:

$$V_n^m = v_{2n}^m v_{2n+1}^m, \quad (21)$$

$$J_n^m = v_{2n-1}^m + v_{2n}^m - \delta^m v_{2n-1}^m v_{2n}^m. \quad (22)$$

The random-time Lotka-Volterra equation of type I" is related to "Random-time Lotka-Volterra equation of type II"

$$\frac{w_n^{m+1}}{(1 + \delta^{m+1} w_{n-1}^{m+1})(1 + \delta^{m+1} w_n^{m+1})} = \frac{w_n^m}{(1 + \delta^m w_n^m)(1 + \delta^m w_{n+1}^m)} \quad (23)$$

via the Miura transformation:

$$v_n^m = \frac{w_n^m}{1 + \delta^m w_n^m}. \quad (24)$$

The random-time Lotka-Volterra equation of type II" is related to "Random-time KdV equation "

$$\frac{1}{u_n^{m+1}} + \delta^{m+1} \frac{1}{u_{n-1}^{m+1}} = \frac{1}{u_n^m} + \delta^m \frac{1}{u_{n+1}^m} \quad (25)$$

via the Miura transformation:

$$w_n^m = u_n^m u_{n+1}^m. \quad (26)$$

Following the same procedure as one developed in the previous paper <sup>2)</sup>, higher order conserved quantities of these equations are expressed by using the higher order conserved quantities of the random-time Toda equation  $H_n$ .
